

Randomize a list of questions within a block or section of questions.

Randomization is used to control answer choice presentation bias. To learn more about your randomization options, visit the [Choice Randomization](#) and [Block Randomization pages](#).

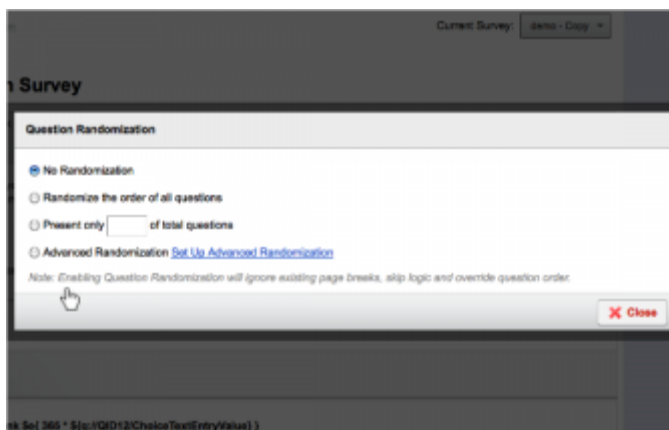

[Set up Question Randomization](#)

In order to set up Question Randomization, all of the questions you'd like to have randomized need to appear in the same block of questions.

1. Click **Block Options** on the question block in the top-right corner.
2. Select **Question Randomization**.

3. When the window appears, select the type of randomization you would like to use:

- **No Randomization:** Does not randomize your questions.
- **Randomize the order of all questions:** Randomly presents all of the questions in the block.
- **Present only (a subset) of the total questions:** Allows you to specify the number of choices (out of the total) to have randomly displayed in the survey (2 of 4, 3 of 7, etc.).
- **Advanced Randomization:** Allows for more randomization options. Move choices in or out of randomization options using the left/right arrow buttons, then be sure to click the **Save** button.

The screenshot shows the 'Advanced Randomization' dialog box. On the left, under 'Fixed Display Order', a list of questions is shown with up and down arrows for reordering. The first question is 'Thank you for participating in our survey. If you drink many bottles of water do you drink a d. You drink (Randomized)'. Below it is 'Which survey software do you currently use?'. On the right, under 'Randomize Questions', there is a section to 'Randomize and insert all items from the list below' with a 'Please rank the following according to your level of...' prompt. Below that is a 'Random Subset' section with a 'Choose and insert' dropdown set to '0' and a 'items from the list below' prompt. At the bottom right is an 'Undisplayed Items' section with a 'Do not display the questions below:' prompt. At the very bottom is a 'Questions per Page' section with a 'Show' dropdown and 'questions on each page'.

- **Fixed Display Order:** Shows the fixed questions in the block and where the randomized subsets fall in the order of questions.
 - **Randomize Choices:** Randomizes the order of all questions moved into the Randomize Choices box.
 - **Randomize Subset:** Specify a number of questions to randomly choose and display (2 of 4, 3 of 7, etc.).
 - **Undisplayed Items:** Specify certain questions you don't want displayed at all.
4. You additionally have the ability to select the number of questions you'd like to have displayed on each page, overriding the page breaks in this block.
 5. Click the **Close** button once you've made your selection.

More Information

[Qtips](#)

- You can view the order in which your questions were displayed by selecting the **Export Randomized View Order data** option in [Download Options](#) in the View Results tab. The display order will appear in the last column of your data file and will be separated by a bar "|" if multiple questions were seen.
